当机器人不再喝咖啡后...

2

登上 Kotlin 岛

- Kotlin 开发 Android 靠谱吗?
- Kotlin 会取代 Java 吗?

2

登上 Kotlin 岛

- Java++
 - Android
 - Server-side
- KotlinJavaScript
- Native(soon)

变量声明

```
var age: Int = 18
```

```
val name: String = "Zhang Tao"
```

函数声明

```
fun echo(name: String): String {  
    println("$name")  
    return name  
}
```

3

使用 Kotlin

运算符

?

3

使用 Kotlin

运算符

String?

String!!

String

运算符

```
data?.let{  
    //当data不为空的时候，执行语句块  
}
```

```
data?:let{  
    //当data为空时才会执行  
}
```

恭喜你，已经入门了
好了，你可以放弃了

图样图森破

5

Kotlin 的特性

- 伴生对象
- 代理
- 函数与闭包(block、Lambda)

伴生对象

```
class StringUtils {  
    companion object {  
        fun isEmpty(str: String): Boolean {  
            return "" == str  
        }  
    }  
}
```

伴生对象

```
class Single private constructor() {  
    companion object {  
        fun get():Single{  
            return Holder.instance  
        }  
    }  
  
    private object Holder {  
        val instance = Single()  
    }  
}
```

5

动态代理

```
class Dog : Animal{  
    override fun bark() {  
        println("Wang")  
    }  
}
```

```
class Cat(animal: Animal)  
    : Animal by animal {  
  
}
```

函数嵌套

```
fun function() {  
    val str = "hello!"  
  
    fun say(count: Int = 10) {  
        println(say)  
        if (count > 0) {  
            say(count - 1)  
        }  
    }  
    say()  
}
```

5

闭包

```
val max = if (a > b) {  
    print("is $a")  
    a  
} else {  
    print("is $b")  
    b  
}
```

5

闭包

```
textView.setOnClickListener({  
    v ->  
        fun onTimer() {  
            toast('')  
        }  
        toast('')  
})
```

开源库

- Kotlin Extensions For Android
- Anko

6

Kotlin Extensions

```
apply plugin: 'kotlin-android-extensions'  
  
classpath "org.jetbrains.kotlin:kotlin-  
android-extensions:$kotlin_version"
```

6

Kotlin Extensions

```
package com.kymjs.myapplication

import ...

class MainActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)
        textView.text = "hello"
    }
}
```

了解原理-Kotlin Extensions

```
public final class MainActivity extends AppCompatActivity {  
    private HashMap _$_findViewCache;  
  
    public void _$_clearFindViewByIdCache() {  
        if (this._$_findViewCache != null) {  
            this._$_findViewCache.clear();  
        }  
    }  
  
    public View _$_findCachedViewById(int i) {  
        if (this._$_findViewCache == null) {  
            this._$_findViewCache = new HashMap();  
        }  
        View view = (View) this._$_findViewCache.get(Integer.valueOf(i));  
        if (view != null) {  
            return view;  
        }  
        view = findViewById(i);  
        this._$_findViewCache.put(Integer.valueOf(i), view);  
        return view;  
    }  
  
    protected void onCreate(@Nullable Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(2130968603);  
        ((TextView) _$_findCachedViewById(R.id.textView)).setText("hello");  
    }  
}
```

```
public final class MainActivity extends AppCompatActivity {
    private HashMap _$_findViewCache;

    public void _$_clearFindViewByIdCache() {
        if (this._$_findViewCache != null) {
            this._$_findViewCache.clear();
        }
    }

    public View _$_findCachedViewById(int i) {
        if (this._$_findViewCache == null) {
            this._$_findViewCache = new HashMap();
        }
        View view = (View) this._$_findViewCache.get(Integer.valueOf(i));
        if (view != null) {
            return view;
        }
        view = findViewById(i);
        this._$_findViewCache.put(Integer.valueOf(i), view);
        return view;
    }

    protected void onCreate(@Nullable Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(2130968603);
        ((TextView) _$_findCachedViewById(R.id.textView)).setText("hello");
    }
}
```

Anko

- Anko是JetBrains开发的一个强大的库
- `'org.jetbrains.anko:anko-sdk25:0.10.0'`
- `'org.jetbrains.anko:anko-support-v4:0.10.0'`
- `'org.jetbrains.anko:anko-appcompat-v7:0.10.0'`

```
verticalLayout {  
    val name = editText()  
    button("Say Hello") {  
        setOnClickListener { toast("Hello, ${name.text}!") }  
    }  
}
```

```
package com.kymjs.myapplication

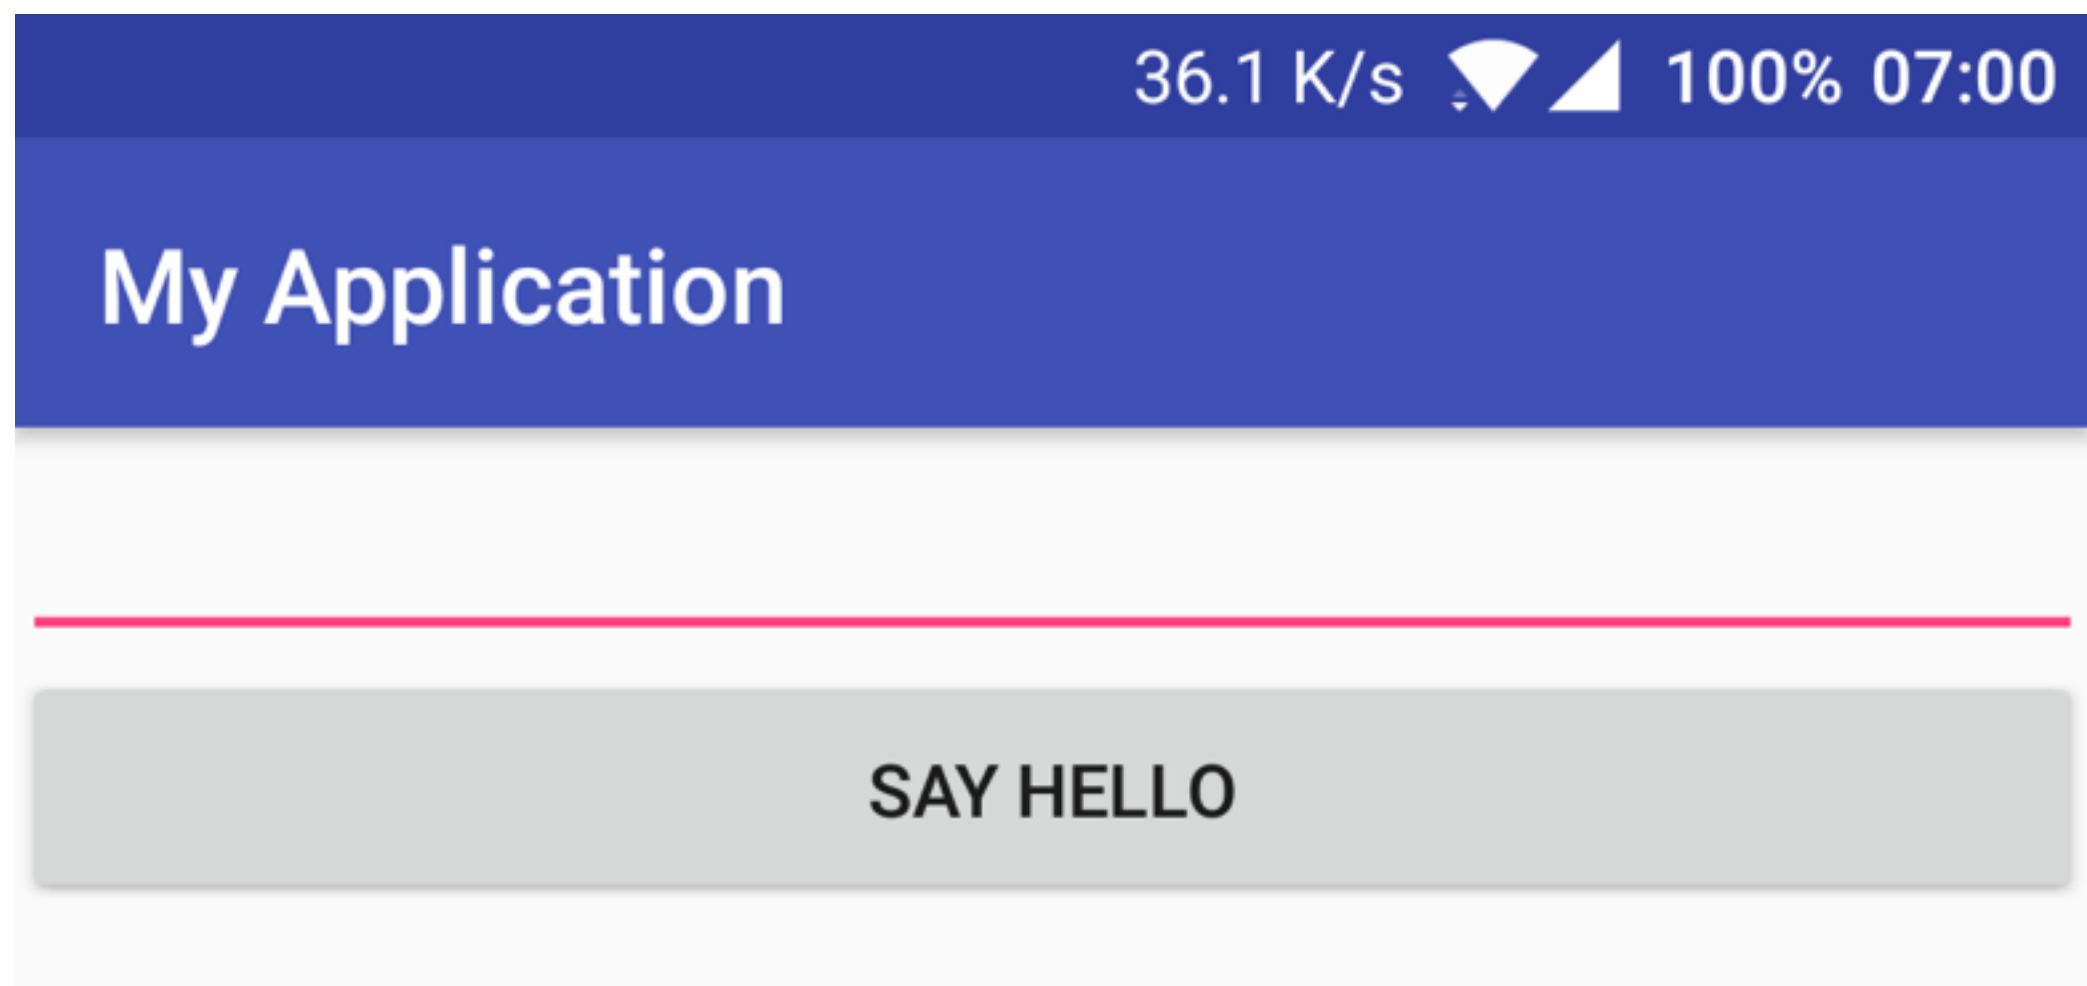

import ...

class MainActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView {
            val name = editText()
            button("Say Hello") {
                setOnClickListener { toast("Hello, ${name.text}!") }
            }
        }
    }
}
```

Anko

从 Java 到 kotlin

- 阅读源码实现
- class 文件
- 网络

当机器人不再喝咖啡后

```
final String[] a = new String[]{"0", "1", "2", "6", "7", "h", "j"};  
Integer[] indexArray = new Integer[]{5, 9, 6, 8, 2, 7, 0, 1, 4, 0, 3};  
List<Integer> list = Arrays.asList(indexArray);
```

```
Observable.just(list)  
    .flatMap((Func1) (integers) → { return Observable.from(integers); })  
    .filter((Func1) (integer) → { return integer < a.length; })  
    .map((Func1) (integer) → { return a[integer]; })  
    .reduce((s, s2) → { return s + s2; })  
    .subscribe((Action1) (s) → {  
        Log.i( tag: "kymjs", msg: "wifiPassword::" + s);  
    });
```

当机器人不再喝咖啡后

```
var wifiPassword = "?"
```

```
val a = arrayOf("0", "1", "2", "6", "7", "h", "j")
```

```
wifiPassword = arrayOf(5, 9, 6, 8, 2, 7, 0, 1, 4, 0, 3)
```

```
    .filter {  
        it in 0 until a.size  
    }  
    .map {  
        a[it]  
    }  
    .reduce { s1, s2 ->  
        "$s1$s2"  
    }
```

```
print(wifiPassword)
```

有些麻烦

- 三目运算符
- 基本数据类型

麻烦还挺多

- 反射
- 断点调试
- 从 Kotlin 转回 Java

Q&A

Thanks

学习，成为更好的自己
